BUSINESS INSIGHTS 360

Interactive Business Intelligence Dashboard

Power BI Project Documentation

A multi-view dashboard for exploring financial, sales, marketing and supply-chain performance.

1. Project Overview

Business Insights 360 is a multi-page Power BI report designed to bring several business performance perspectives into one interactive experience. The landing page provides navigation to dedicated Finance, Sales, Marketing and Supply Chain views, alongside information, executive and support areas.

Project objectives

- Provide a consolidated view of business performance across key functions.
- Track financial measures such as net sales, gross margin, operating expense and net profit.
- Explore customer, product, segment and regional performance.
- Review forecast accuracy, forecast error and inventory-related risk indicators.
- Support analysis through year, quarter, region/market, customer and product/segment filters.

Report navigation and interaction

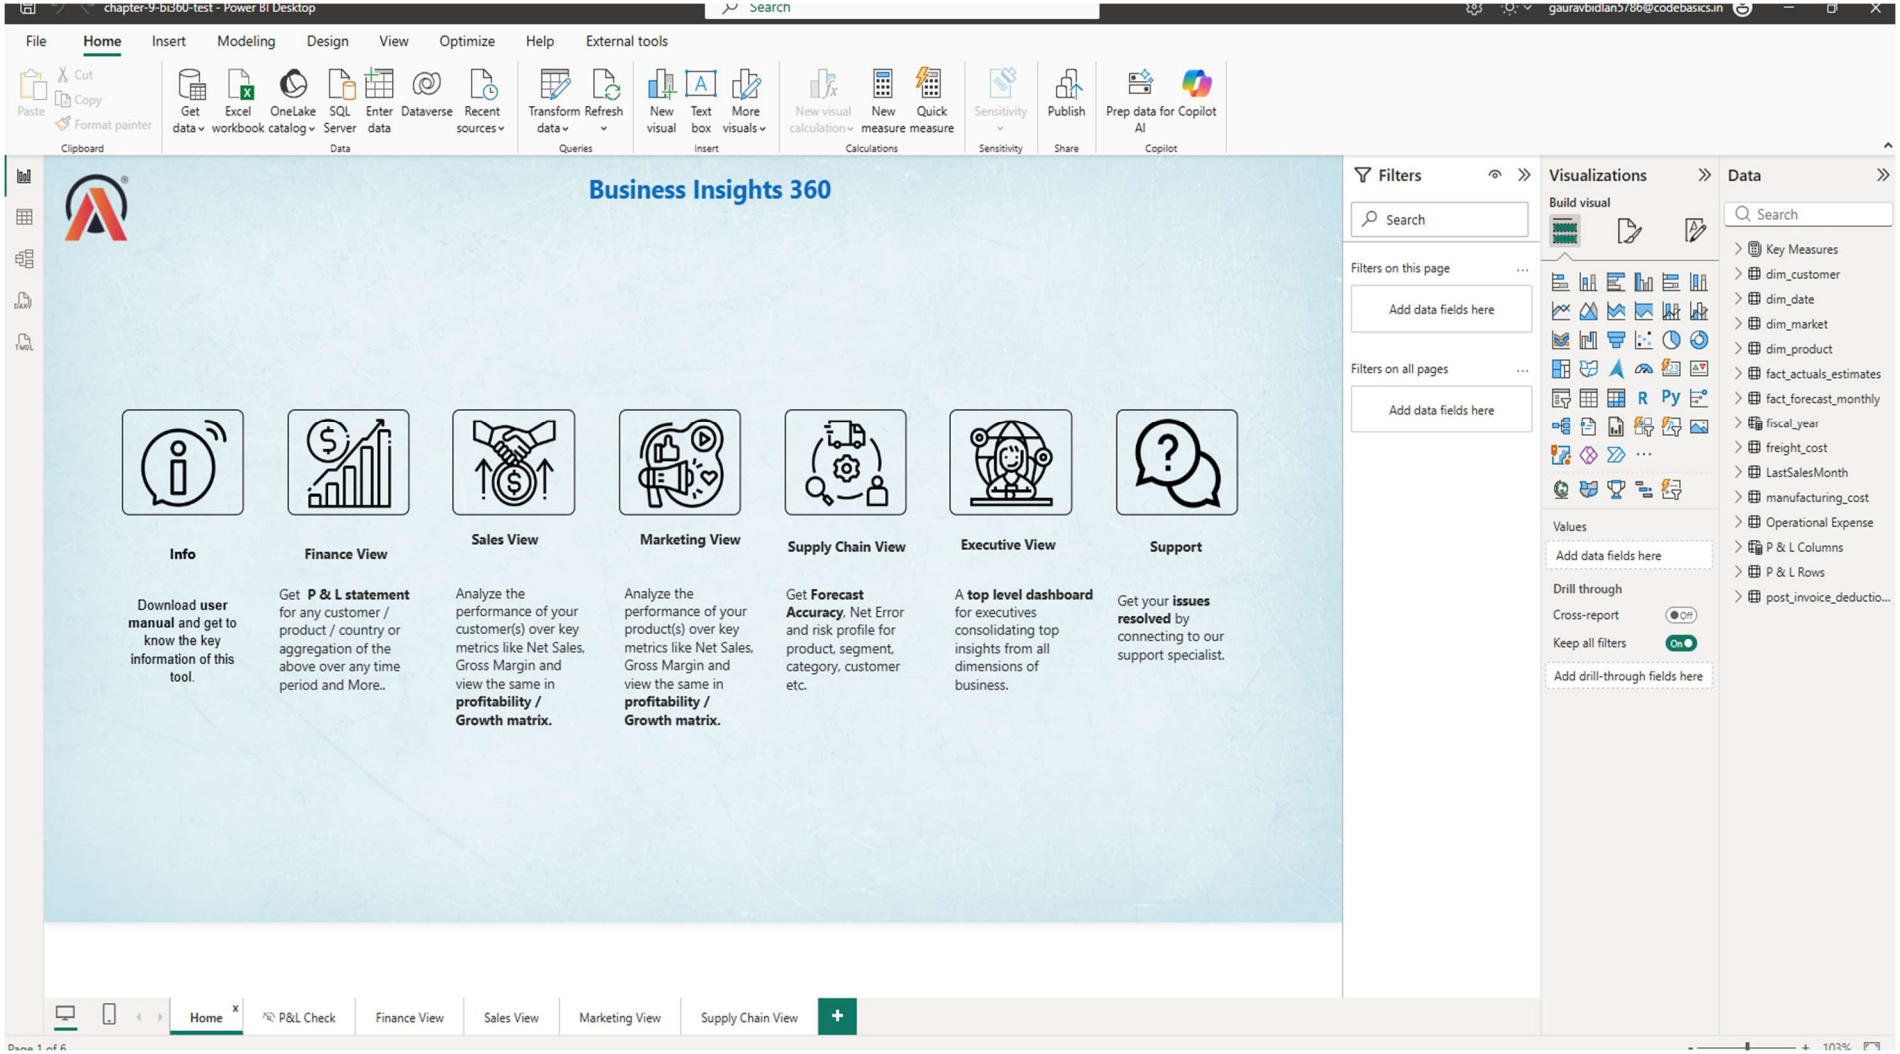

The report uses a consistent left-side navigation rail and shared slicers. Visible controls include region/market, customer, segment/category/product, year, quarter, YTD and YTG selections. These controls are intended to let a viewer narrow the analysis and compare results across business dimensions.

2. Dashboard Walkthrough

The following pages reproduce the supplied Power BI screenshots. Explanations describe only what is visible in the provided captures; figures reflect the selected report context shown in those screenshots and may change when slicers or filters are changed.

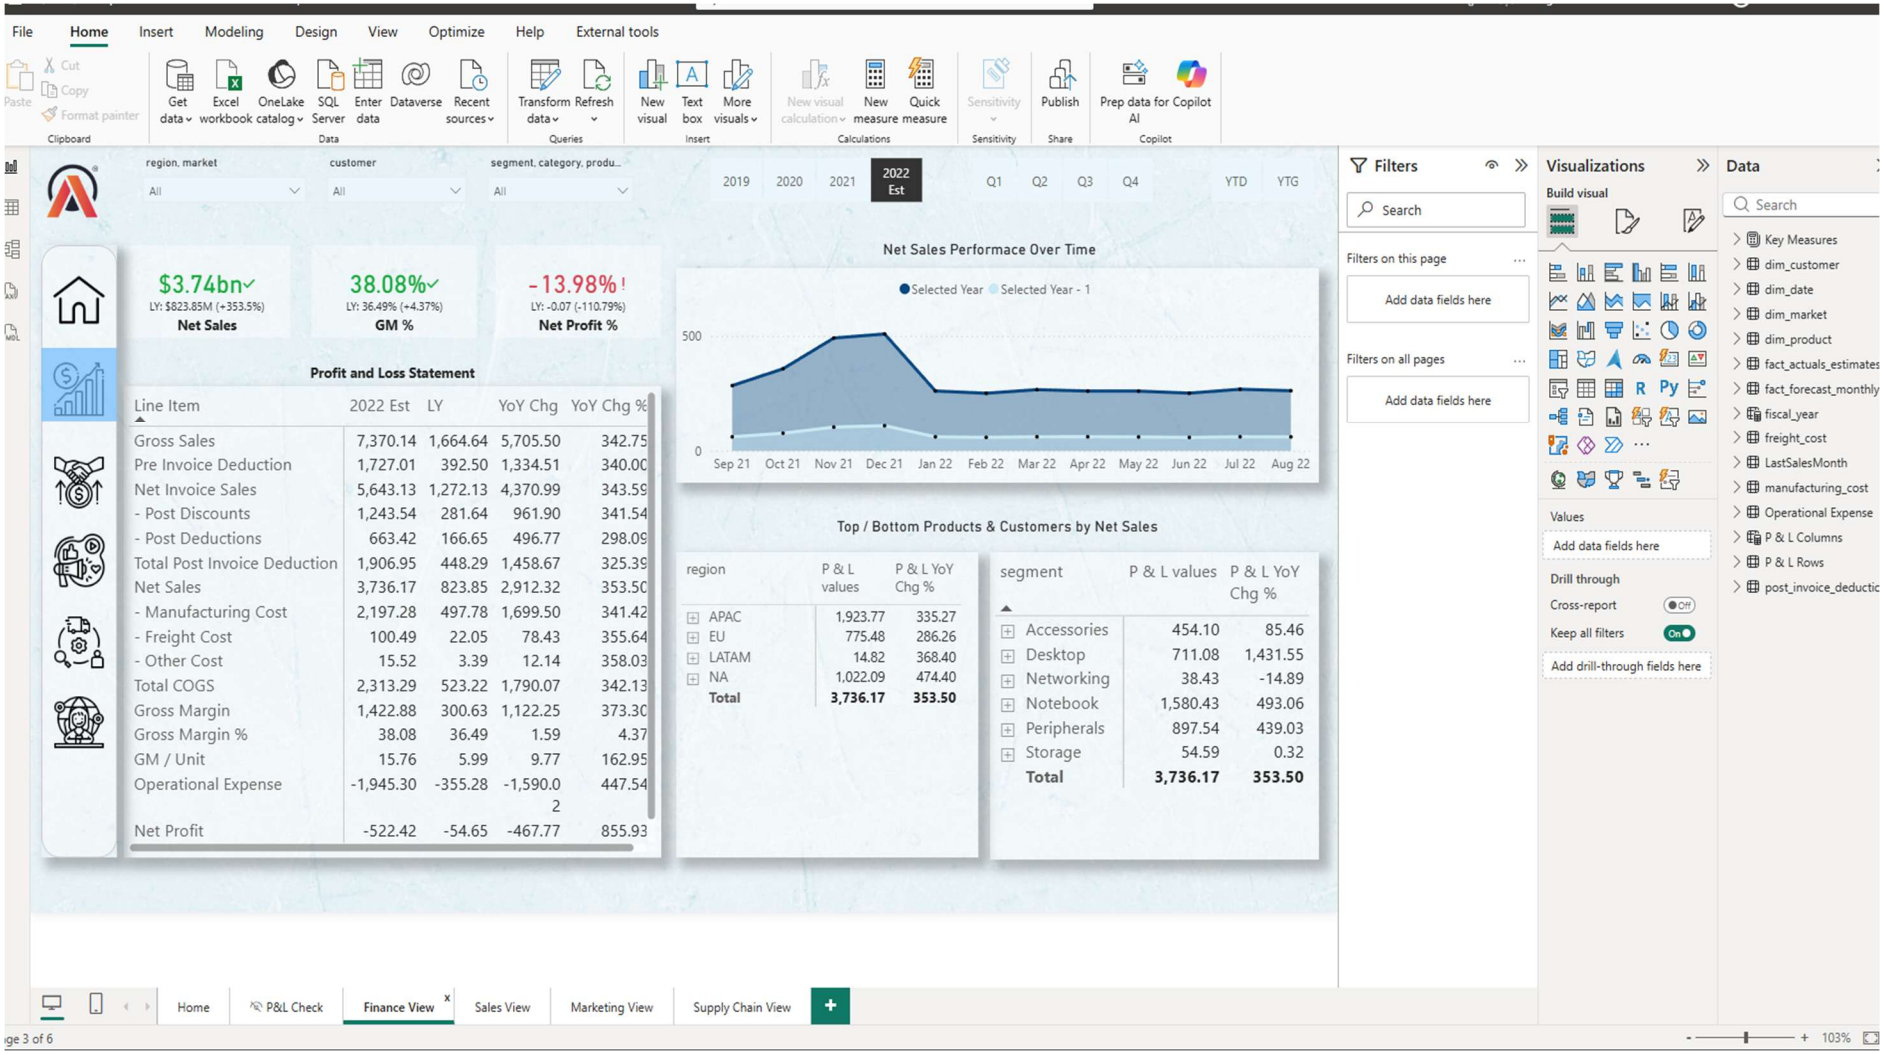

2.1 Home

A landing page that introduces Business Insights 360 and provides navigation to the Info, Finance, Sales, Marketing, Supply Chain, Executive and Support views.

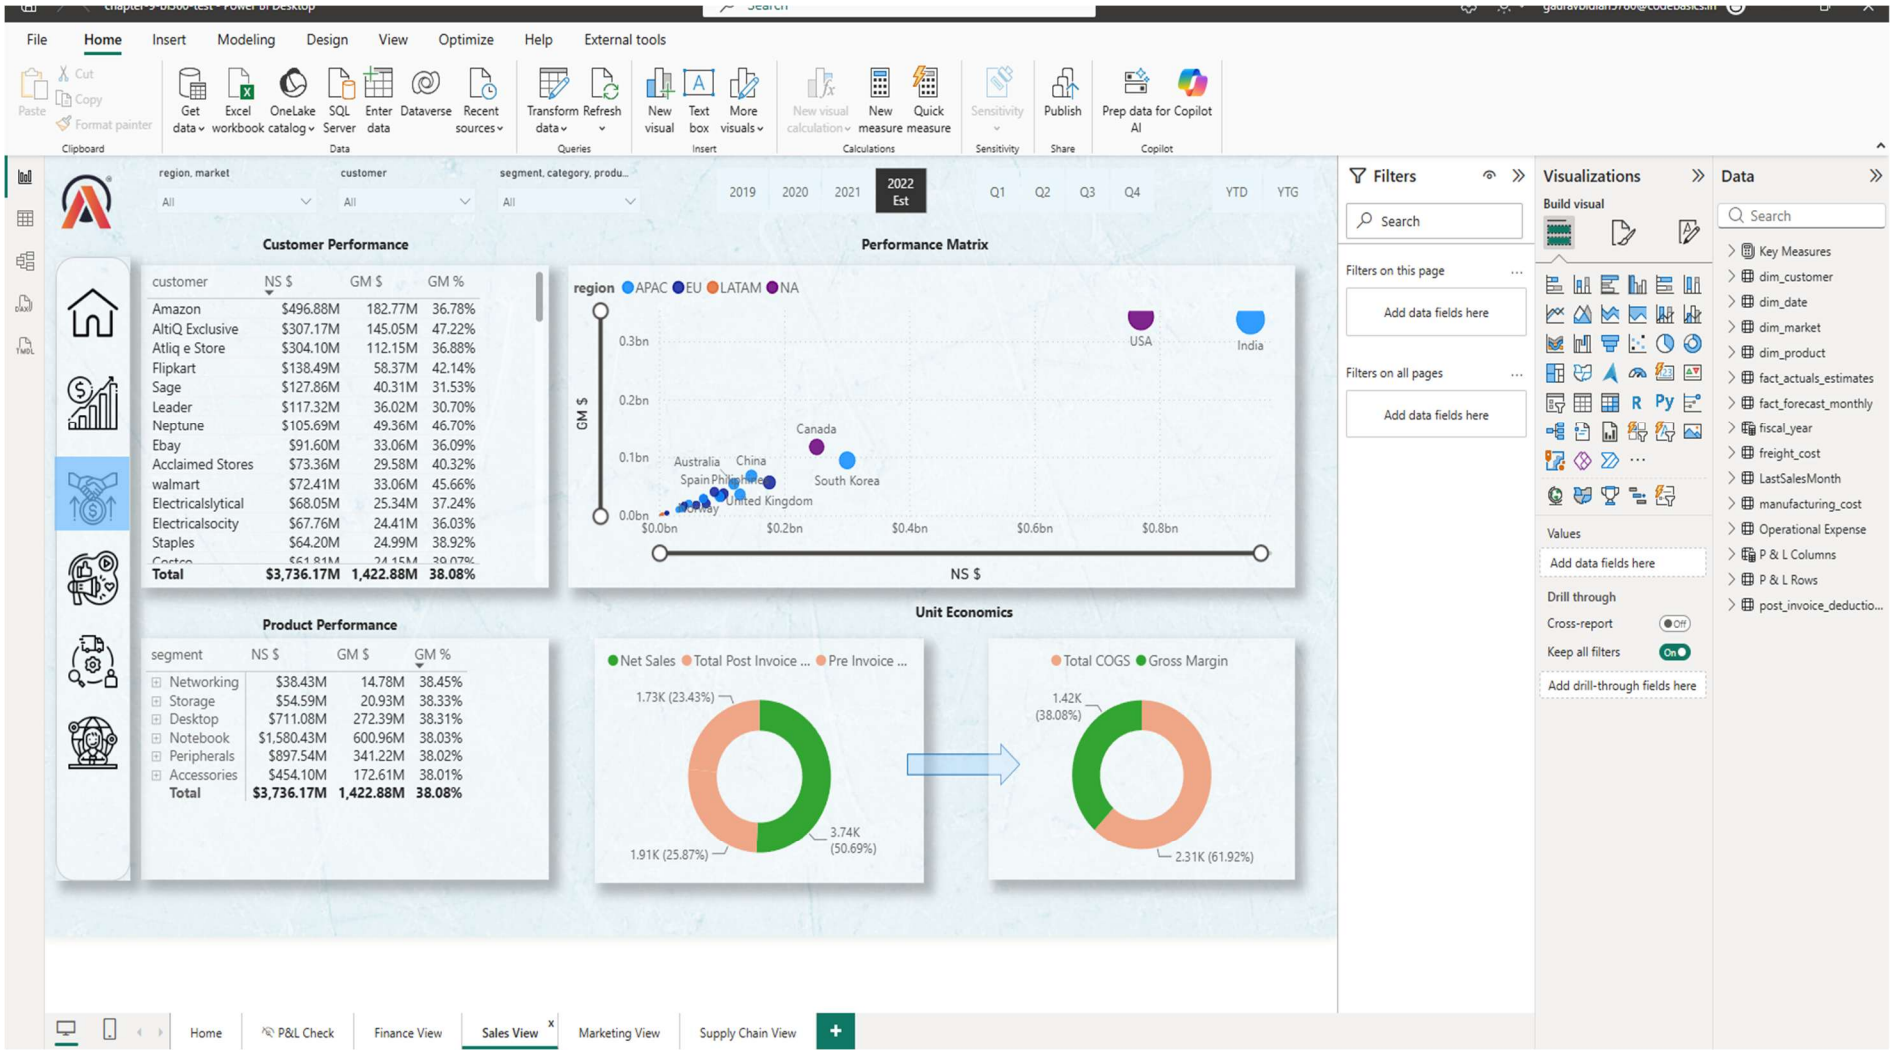

2.2 Finance View

A financial performance page combining headline KPIs, a profit and loss statement, a monthly sales trend, and regional and segment comparisons.

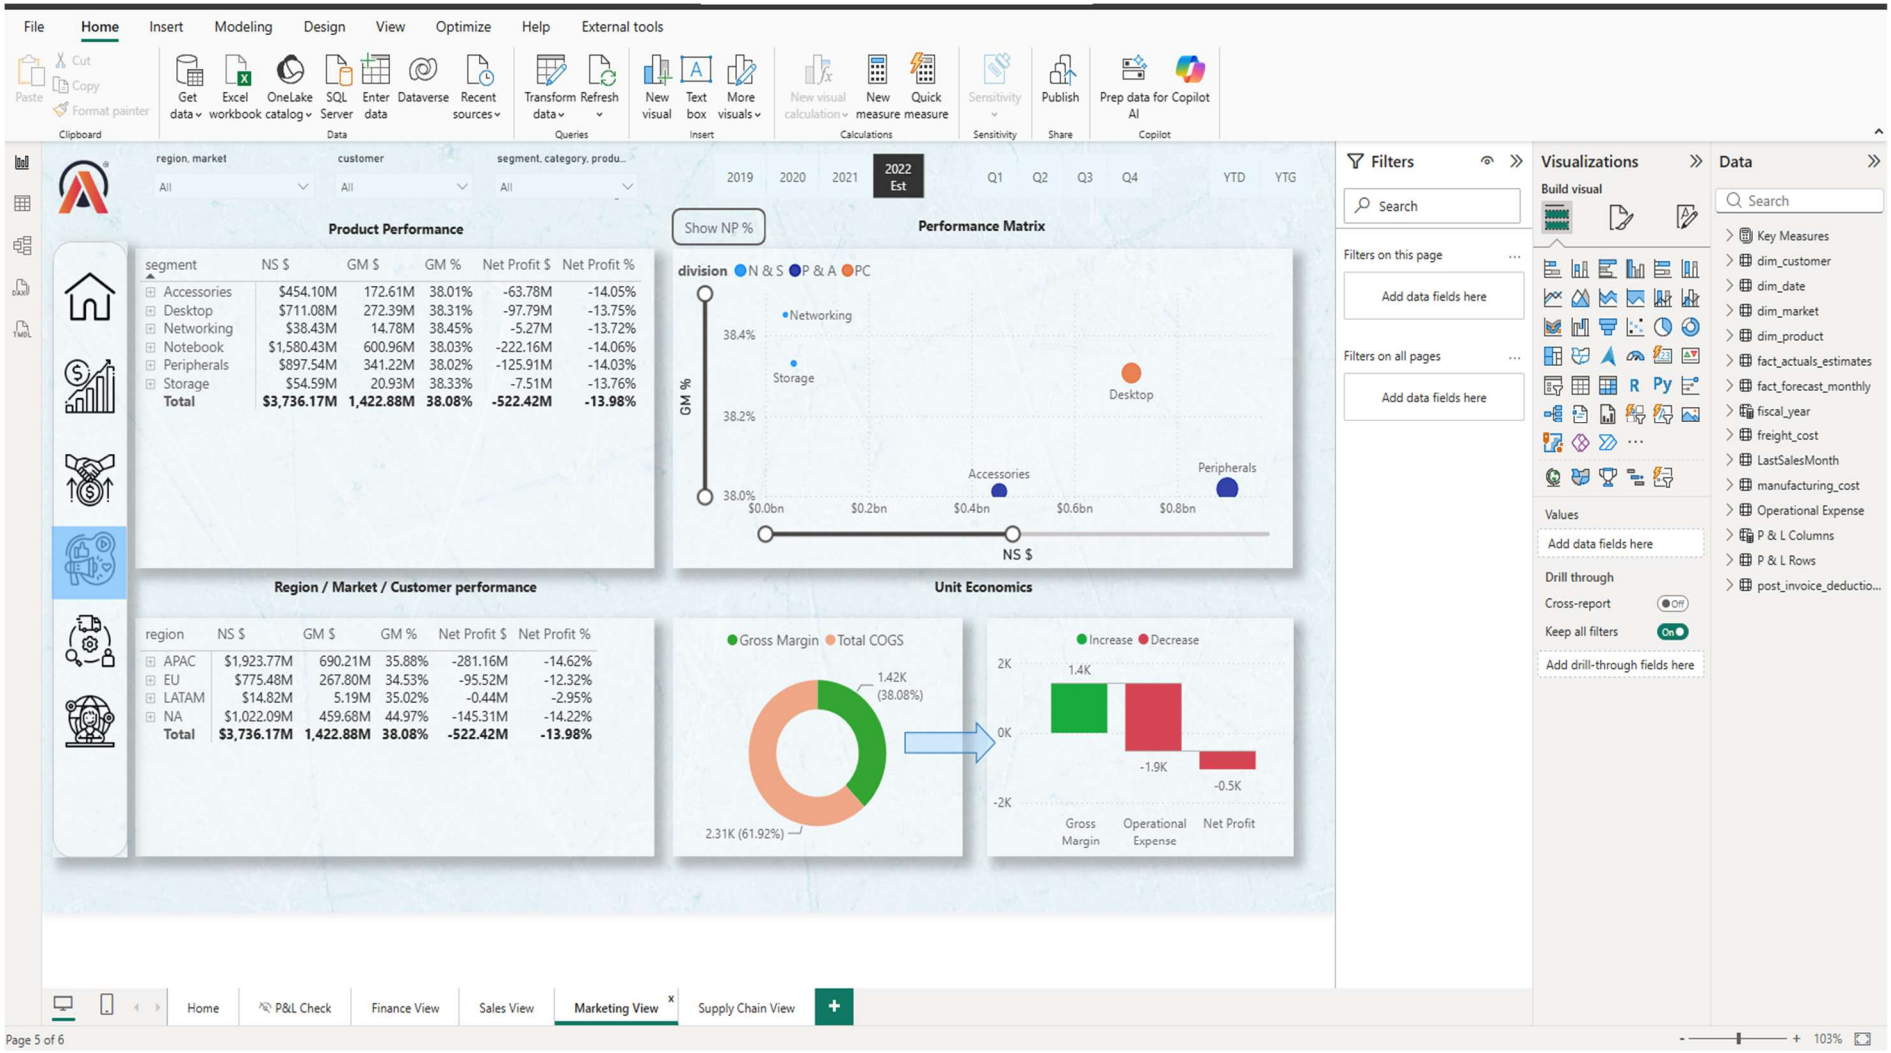

2.3 Sales View

A sales analysis page showing customer and product performance, regional comparisons, and unit-economics visuals.

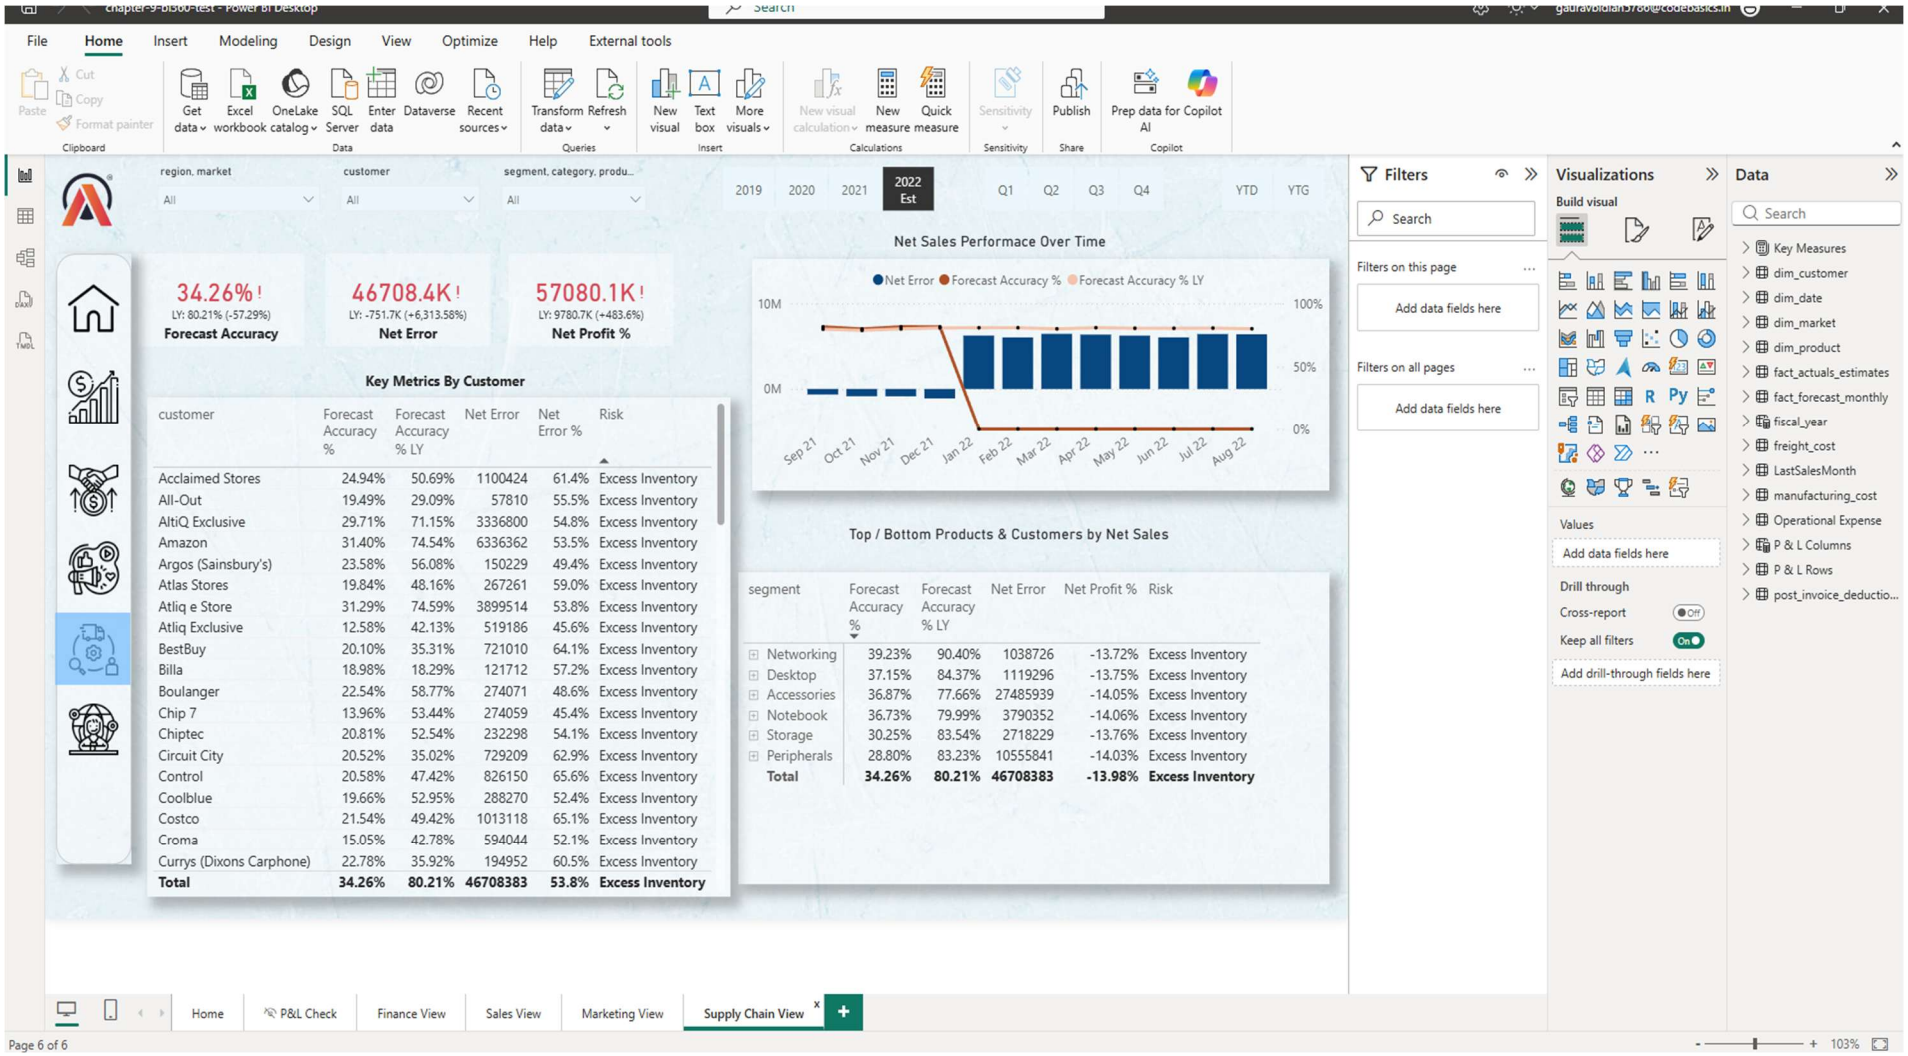

2.4 Marketing View

A marketing and product-performance page with segment-level metrics, a performance matrix, regional results, and cost-versus-margin visuals.

2.5 Supply Chain View

A supply-chain page focused on forecast accuracy, net error, customer-level risk, product/segment risk, and monthly forecast performance.

3. Key Observations from the Supplied Screenshots

Finance snapshot

In the Finance View capture, the selected period is labelled 2022 Est. The headline cards show net sales of approximately $3.74bn, gross margin of 38.08%, and net profit of -13.98%. The profit and loss statement shows net sales of $3,736.17M, gross margin of $1,422.88M, operating expense of -$1,945.30M and net profit of -$522.42M. This snapshot indicates that positive gross margin is outweighed by operating expense, resulting in a negative net profit.

Sales and product performance

The Sales View compares customers and product segments using net sales and gross margin measures, and includes regional performance and unit-economics visuals. The visible product table shows the Notebook segment as the largest net-sales contributor in the displayed context (about $1,580.43M), while the customer table ranks customers by net sales. The report also includes country/region comparisons.

Marketing and margin analysis

The Marketing View includes segment-level net sales, gross margin and net profit measures, plus a performance matrix. The displayed totals are consistent with the financial snapshot: net sales of $3,736.17M, gross margin of $1,422.88M, gross margin percentage of 38.08%, and net profit of -$522.42M (-13.98%).

Supply-chain performance

The Supply Chain View highlights forecast accuracy of 34.26%, compared with a displayed last-year value of 80.21%, and a net error total of approximately 46.7 million in the report's displayed units. The customer and segment tables classify the shown risk as “Excess Inventory.” The monthly chart supports review of forecast performance over time.

Cross-functional value

Together, the views connect commercial performance with profitability and operational planning. A business user can move from overall sales and margin to customer or product detail, then examine forecast accuracy and inventory risk in the supply chain.

4. Tools, Data and Analytical Concepts

The supplied screenshots confirm that the project was built in Microsoft Power BI Desktop. The visible data model pane contains tables with names such as:

- dim_customer, dim_date, dim_market and dim_product
- fact_actuals_estimates and fact_forecast_monthly
- Key Measures and supporting cost / P&L tables

The report demonstrates interactive report navigation, slicers, KPI cards, tables/matrices, time-series charts, scatter/bubble-style performance visuals, and cost/margin comparisons. The screenshots alone do not prove which specific Power Query transformations, DAX formulas, relationships or refresh processes were implemented; those technical details should be added only if confirmed from the PBIX file or project notes.

5. Conclusion

Business Insights 360 presents a broad business-performance reporting experience across finance, sales, marketing and supply chain. Its main strength is the ability to explore related measures through a consistent, filter-driven interface. The supplied 2022 estimate snapshots also illustrate how the report can surface important management questions, including the relationship between gross margin and operating expense and the gap between current and prior-year forecast accuracy.

For a complete public portfolio release, consider adding the PBIX file (if shareable), a short data-source note, the business definitions for key measures, and a note explaining whether figures are actuals, estimates or sample data.
